BENZOPYRAN DERIVATIVES, METHOD OF PRODUCTION AND
USE THEREOF

5 The present invention relates to novel benzopyran derivatives, to their method of production, to composition comprising the derivatives and use thereof.

ATP-sensitive potassium channels (K_{ATP} channels) are of particular interest. Such channels are present in multiple cell types including endocrine cells, skeletal and smooth muscle cells, cardiac cells and central neurons. K_{ATP}
10 channels are involved in main physiological processes such as hormone secretion, smooth muscle cell contractile activity, myocardial protection and neurotransmitters release.

Several compounds are known to activate K_{ATP} channels and have been named
15 "potassium channel openers" (PCOs).

Potassium channel openers are known to be able to relax vascular smooth muscles and have therefore been used for the treatment of hypertension.

It is well known that the vasorelaxant activity of benzopyran PCOs such as cromakalim (figure 1) is partly due to the presence of an OH group in the 3-
20 position of the heterocycle.

25

Figure 1

Moreover, cromakalim is poorly active as an inhibitor of insulin secretion reflecting a poor activity as a PCO on the pancreatic K_{ATP} channels.

We have now found novel benzopyran derivatives without an OH group in the 3-position of the benzopyran ring but bearing an arylurea or arylthiourea group in the 4-position useful as potassium channel activators which produce relaxant activity on smooth muscle cells and surprisingly are also active on the pancreatic endocrine tissue as inhibitors of insulin secretion.

In accordance with the present invention, it is provided novel benzopyran derivatives having the general formula (I)

The benzopyran derivatives of formula (I) and combinations thereof, can be formulated in compositions such as tablets, capsules or elixirs for oral administration, in sterile solutions or suspensions.

The benzopyran derivatives of the present invention interact with the potassium channels and hence act as openers or blockers of the ATP-regulated potassium channels, which make them useful in the treatment of various diseases of the cardiovascular system, e.g. cerebral ischemia, hypertension, ischemic heart diseases, angina pectoris and coronary heart diseases, the pulmonary system, the gastrointestinal system, the central nervous system and the endocrinological system.

Since some K_{ATP} channel openers are able to antagonize vasospasms in basilar or cerebral arteries, the benzopyran derivatives of the present invention can be used for the treatment of vasospastic disorders, subarachnoid haemorrhage and migraine.

The benzopyran derivatives of the present invention may also be used for the treatment of diseases associated with decreased skeletal muscle blood flow such as Raynaud's disease and intermittent claudication.

Further, the benzopyran derivatives of the invention may be used for the treatment of chronic airway diseases, including asthma, and for treatment of detrusor muscle instability secondary to bladder outflow obstruction and therefore for kidney stones by aiding their passage along the urethra.

The present benzopyran derivatives could also be used for treatment of conditions associated with disturbances in gastrointestinal motility such as irritable bowel syndrome. Additionally, these benzopyran derivatives can be used for the treatment of premature labour and dysmenorrhea.

Potassium channel openers hyperpolarizes neurons and inhibit neurotransmitter release and it is expected that such benzopyran derivatives can be used for the treatment of various diseases of the central nervous system, e.g. epilepsy, ischemia and neurodegenerative diseases, and for the management of pain.

5

Further, potassium channel openers promote hairgrowth, therefore, the benzopyran derivatives of the present invention can be used for the treatment of baldness.

10 Potassium channel openers also relax urinary bladder smooth muscle, thus, the benzopyran derivatives of the present invention can be used for the treatment of urinary incontinence.

In diseases such as nesidioblastosis and insulinoma in which a hypersecretion of insulin causes severe hypoglycemia, the benzopyran derivatives of the present
15 invention can be used to reduce insulin secretion. In obesity, hyperinsulinemia and insulin resistance is very frequently encountered. This condition could lead to the development of noninsulin dependent diabetes (NIDDM). It is expected that potassium channel openers and hence the benzopyran derivatives of the present invention can be used for reducing the hyperinsulinemia and thereby
20 prevent diabetes and reduce obesity. In overt NIDDM, treatment of hyperinsulinemia with potassium channel openers, and hence the present benzopyran derivatives, can be of benefit in restoring glucose sensitivity and normal insulin secretion.

In early cases of insulin dependent diabetes (IDDM) or in prediabetic cases,
25 potassium channel openers and hence the present benzopyran derivatives can be used to induce beta cell rest which may prevent the progression of the autoimmune disease.

The potassium channel openers of the present invention can be administered in combination with an immunosuppressant or with an agent like nicotinamide, which will reduce autoimmune degeneration of beta-cells.

5 Combining beta-cell rest with a treatment protecting the beta-cells against cytokine mediated beta-cell impairment/cytotoxicity is another aspect of this invention.

Insulin requiring or Type 1 diabetes (IDDM) as well as late onset IDDM (also known as type 1.5. e.g. non-insulin-requiring Type 2 (NIIDM) patients with autoreactivity against beta-cell epitopes that later turns insulin requiring) have
10 circulating autoreactive monocytes/lymphocytes that homes to the islets/beta-cells and releases their cytokines. Some of these cytokines (e.g. interleukin-1 β (IL-1 β), tumour necrosis factor α (TNF α) and interferon γ (IFN γ)) are specifically toxic to the beta-cells, e.g. through the induction of nitric oxide (NO) and other free radicals. Inhibition of this cytotoxicity, e.g. by co-administering
15 nicotinamide (NA), a derivative hereof or other cytokine protective compounds to the prediabetic/diabetic patients treated with the PCO compound, is an example of this aspect. Nicotinamide belongs to the B-vitamin family and is derived from nicotinic acid by amidation of the carboxyl group. It processes none of nicotine's pharmacological properties. NA is converted into NAD $^{+}$,
20 which acts as a coenzyme for proteins involved in tissue respiration. NA has been proposed to influence several of the putative intracellular molecular events following immune attack on the beta-cells. Animal experiments and early non-blinded experiments in humans have indicated a protective role of this compound against IDDM as well as in cytokine/immune mediated beta-cell destruction.

25 Yet another aspect of this application concerns the use of a PCO compound alone or in combination with the inhibitor of cytokine/immune mediated beta-cell impairment, in transplantation, e.g. islet transplantation into diabetes patients.

Benzopyran derivatives of the present invention which act as blockers of K_{ATP} -channels can be used for the treatment of NIDDM.

Preferably, the benzopyran derivatives of the present invention may be used for treatment or prevention of diseases of the endocrinological system such as hyperinsulinaemia and diabetes.

Accordingly, in another aspect the invention relates to a benzopyran derivative of the general formula I or a pharmaceutically acceptable acid addition salt thereof for use as a therapeutically acceptable substance, preferably for use as a therapeutically acceptable substance in the treatment of hyperinsulinaemia and treatment or prevention of diabetes.

Furthermore, the invention also relates to the use of benzopyran derivatives of formula I as medicaments useful for treating hyperinsulinaemia and treating or preventing diabetes.

3-Thienyl isothiocyanates (5 – scheme 2) are prepared by treatment of 3-aminothiophenes (4 – scheme 2) with 1,1'-thiocarbonyldiimidazole in 1,4-dioxane according to the following procedure :

1,1'-Thiocarbonyldiimidazole (1.01 g, 0.00567 mol) was added to a stirred solution of 3-aminothiophene (0.55 g, 0.0056 mol) dissolved in dry 1,4-dioxane (15 mL). The mixture was refluxed under nitrogen for 20 minutes.

The solution was concentrated under reduced pressure and diethylether was added to the residue. The organic layer was washed with a 0.1 M hydrochloric acid solution. Diethylether was removed under reduced pressure. The resulting oil was used without further purification.

Compounds of formula (IV) wherein R_7 represents

are prepared according to literature. The method of preparation is described by Binder, D.; Habison, G. and Noe, C. in *Communications* 1977, 255, incorporated by reference and illustrated in scheme 3.

The method of preparing the compounds of formula (I) is further illustrated in scheme 1 and in the following examples which, however, are not to be construed as limiting.

Melting points were determined on a Büchi 530 capillary apparatus and are uncorrected. IR spectra were recorded as KBr pellets on a Perkin-Elmer 1000 FTIR spectrophotometer. The ^1H NMR spectra were recorded on a Bruker AW-80 (80 MHz) instrument using d_6 -DMSO as solvent with hexamethyldisiloxane (HMDS) as an internal standard; chemical shifts are reported in δ values (ppm) relative to internal HMDS. The abbreviation s = singulet, d = doublet, t = triplet, q = quadruplet, m = multiplet and b = broad are used throughout. Elemental analyses (C, H, N, S) were realized on a Carlo-Erba EA 1108-elemental analyzer and were within ± 0.4 % of the theoretical values. All reactions were routinely checked by TLC on silica gel Merck 60 F₅₂₄.

BIOLOGICAL ESSAYS

The activity of the compounds as potassium channel openers can be measured by measurement of tension in rat aorta rings, measurement of ^{86}Rb (^{42}K substitute) outflow from rat aorta rings, measurement of insulin release from incubated rat pancreatic islets together with measurement of ^{86}Rb outflow from perfused rat pancreatic islets.

Measurement of insulin release from incubated rat pancreatic islets was performed according to the following procedure.

Experiments were performed with pancreatic islets isolated from adult fed Wistar rats (Charles River Laboratories, Belgium).

Groups of 10 islets, each derived from the same batch of islets, were preincubated for 30 minutes at 37 °C in 1 mL of a physiological salt medium (in mM : NaCl 115, KCl 5, CaCl₂ 2.56, MgCl₂ 1, NaHCO₃ 24) supplemented with 2.8 mM glucose, 0.5 % (w:v) dialyzed albumin (Sigma) and equilibrated against a mixture of O₂ (95 %) and CO₂ (5 %). The islets were then incubated at 37 °C for 90 minutes in 1 mL of the same medium containing 16.7 mM glucose and, in addition, the required benzopyran derivative.

The release of insulin was measured radioimmunologically according to Leclercq-Meyer et al., *Endocrinology*, 1985, 116, 1168-1174 using rat insulin as a standard.

Residual insulin secretion was expressed as a percentage of the value recorded in control experiments (100 %); i.e. in the absence of drug and presence of 16.7 mM glucose. Measurement of ^{86}Rb outflow from perfused rat pancreatic islets was performed according to the following procedure. Groups of 100 islets were incubated for 60 min in a medium containing 16.7 mM glucose and ^{86}Rb (0.15 - 0.25 mM; 50 $\mu\text{Ci/ml}$). After incubation, the islets were washed three times and then placed in a perfusion chamber. The perfusate was delivered at a constant rate (1.0 ml/min). From the 31st to the 90th min, the effluent was continuously collected over successive periods of 1 min each. An aliquot of the effluent (0.6

ml) was used for scintillation counting. At the end of the perfusion, the radioactive content of the islets was determined. The outflow of ^{86}Rb (cpm/min) was expressed as a fractional outflow rate (% of instantaneous islet content/min; FOR).

Measurement of tension in rat aorta rings was performed according to the following procedure.

Experiments were performed with aortae removed from adult fed Wistar rats (Charles River Laboratories, Belgium).

A section of the thoracic aorta was cleared of adhering fat and connective tissue and was cut into transverse rings (3-4 mm long). The endothelium was removed and the segments suspended under 1.5 g tension in an organ bath containing 20 mL of a physiological solution (in mM : NaCl 118, KCl 4.7, CaCl_2 2.5, NaHCO_3 25, KH_2PO_4 1.2, MgSO_4 1.2, glucose 5). The physiological solution was maintained at 37 °C and continuously bubbled with a mixture of O_2 (95 %) and CO_2 (5 %). Isometric contractions were measured with a force-displacement transducer. After 60 minutes of equilibration, the rings were exposed to KCl (30 or 80 mM). When the tension had stabilized, the chroman derivative was added to the bath at increasing concentrations until maximal relaxation (or until 300 μM). Some experiments were repeated in the continuous presence of 1 or 10 μM glibenclamide in the bathing medium.

The relaxation response was expressed as the percentage of the contractile response to KCl. The ED_{50} values (concentration evoking 50 % inhibition of the plateau phase induced by KCl) were assessed from dose-response curves using Datanalyst software (EMKA Technologies, France).

Measurement of ^{86}Rb outflow from rat aorta rings was performed according to the following procedure.

Experiments were performed with thoracic rat aorta rings (2 mm long) isolated from adult fed Wistar rats (Charles River Laboratories, Belgium).

The aorta rings were preincubated for 30 min at 37 °C in a physiological solution (in mM : NaCl 115, KCl 5, CaCl₂ 2.56, MgCl₂ 1, NaHCO₃ 24) equilibrated
 5 against a mixture of O₂ (95 %) and CO₂ (5 %). After preincubation, the aorta rings were incubated for 60 min at 37 °C in the same medium containing, in addition, ⁸⁶Rb ion (0.15-0.25 mM; 50 microCi.mL⁻¹). Following incubation, the segments were washed four times with non-radioactive medium and then placed in a perfusion chamber. The perfusate was delivered at a constant rate (1.0
 10 mL.min⁻¹). From the 31st to the 90th min, the effluent was continuously collected over successive periods of 1 min each and examined for its radioactive content by scintillation counting. At the end of the perfusion, the radioactive content of the aortic segments was also determined.

The experiments were conducted in the presence of 30 mM KCl in the perfusing
 15 medium to mimic the experimental conditions used to measure muscle tension. The efflux of ⁸⁶Rb was expressed as a fractional outflow rate (FOR: % of instantaneous aorta content per min).

The validity of ⁸⁶Rb (⁴²K substitute) as a tracer for the study of K⁺ handling in aorta rings has been previously assessed (Lebrun et al., Pharmacology, 1990, 41,
 20 36-48; Antoine et al., Eur. J. Pharmacol., 1992, 216, 299-306).

In such models, PCOs such as diazoxide, pinacidil and cromakalim have been reported to reduce the glucose-induced insulin output and/or to exhibit myorelaxant activity as described by de Tullio et al., J. Med. Chem., 1996, 39,
 25 937-948.

Table 1 depicts the biological data obtained with the new benzopyran derivatives. Cromakalim, diazoxide and pinacidil were used as reference compounds.

Results obtained on rat pancreatic islets indicated that the benzopyran derivatives inhibited insulin secretion or expressed myorelaxant activity.

According to the chemical structure of the drugs, the nature of the substituent in the 4-position appeared to be important for the inhibitory effect on insulin release.

The benzopyran derivatives according to the invention are effective over a wide dosage range. In general satisfactory results are obtained with dosage from 0.05 to 1000 milligrams of a benzopyran derivative of formula I, compounded with

physiologically acceptable vehicle, carrier, excipient, binder, preservative, stabilizer, flavor and the like in a unit dosage form as called for by accepted pharmaceutical practice. The exact dosage depends upon a lot of factors such as mode of administration and form in which it is administered.
